Week-5(Experiment 4)

Observation Book:

procedure:

1. Connect the end devices and server with the router using copper straight-through as shown in the topology.
2. On Server.

go to desktop & ip configuration and set the static address as:

Ip address: 10.0.0.2
Subnet mask: 255.00.0
Default Gateway: 10.0.0.1

then, go to services & DHCP
configure the pools like below.

Switch1: set the following

poolname: switch1
default gateway: 10.0.0.1
start IP address: 10.0.0.3

Maximum number of users: 100
and add this.

for, switch2: set the following

poolname: switch2
default Gateway: 20.0.0.1
Start IP address: 20.0.0.3

maximum number of users: 100

3. Open CLI on the router, execute the commands

- Router#enable, Router#config terminal,
- Router(config)# interface fastEthernet 0/0
- Router(config)# ip address 10.0.0.1 255.0.0.0
- Router(config)# ip helper-address 10.0.0.2
- Router(config)# no shutdown
- exit

→ Router(config)# interface fastEthernet 1/0

- Router(config)# ip address 20.0.0.1
255.0.0.0

- Router(config)# ip helper-address
10.0.0.2

- Router(config)# no shutdown
- exit

Observation:

Set up the router with the fast-Ethernet cable connected to the two switches setting up the ~~server~~ helper address which is the IP address of the server, the other network 20.0.0.0 and access the DHCP server which has been set in the pool server in the server.
